BSRecover is a tool to help to recover from a BSOD or Blue Screen. To minimize the delay of a BSOD, it uses an innovative approach by capturing kernel debugging information. You will be able to fix or repair your BSOD while the crash is still occurring. Unlike other tools, it does not need a Windows installation CD. It can be run from a USB stick. The utility has been developed by SysRecovery, and the code is open source. In case of a serious BSOD error, the program automatically scans the registry for the presence of BSOD related keys. BSRecover helps you to activate (or deactivate) specific Recovery Mode images stored in the Windows registry. You can choose which of the available Recovery modes to activate. Any errors detected by BSRecover are automatically stored in the BSRecord.txt file for further analysis. Requirements: BSRecover is compatible with Windows XP, Vista, 7 and 8. There are no external dependencies, but the program does use the following files: BootMgr (Windows NT boot manager) BootEx (Windows NT boot loader) You can find the latest version of BSRecover at www.SysRecovery.com.
